A/UX 3.1 Update CD and Macintosh Partition Problem (6/94)

Article Created: 29 June 1994

TOPIC -----

I tried to update my A/UX computer to version 3.1, and I get a message telling me the installation was not successful, and that the original system was restored. Why is this happening?

DISCUSSION -----

If your Macintosh Partition has insufficient space to have its software updated, the installer may inform you that installation was not successful and your original system software has been restored, but will not tell you why. You may have added files to your Macintosh Partition which is taking up the space needed.

If you have this problem with your Macintosh Partition when using the A/UX 3.1 update CD, try one of the following:

- Remove unnecessary files from your Macintosh Partition and try updating again.
- The default Macintosh Partition is 4 MB to maximize the space available to A/UX. Other partition options are available as custom selections within HD SC Setup. If you need to use additional software in your Macintosh Partition beyond what is necessary to boot and maintain A/UX, the default 4 MB Macintosh Partition size may be insufficient for your needs. If this is so, you may need to re-partition the drive using either one of the pre-set custom partition maps, or one you create so that your Macintosh Partition will be large enough to accommodate your needs.

IMPORTANT: Using HD SC Setup to change the size of ANY partition will require that you re-initialize your entire hard drive. Because of this, you **MUST** re-install all of A/UX and your server's applications as well, so it is **VITAL** that you backup your data, and restore it after re-installation is complete.
