A/UX 2.0.1: Problem Recognizing 800K Drives with Macintosh IIfx

Article Created: 13 June 1991

Article Reviewed/Updated: 17 August 1993

TOPIC -----

I am using A/UX on a Macintosh II that has been upgraded to a Macintosh IIfx.

A/UX seems to think my 800K floppy drive is a 400K drive and that it is bad. In fact, we can format floppies to 800K and otherwise use the drive. But the A/UX Finder and DOSMounter certainly believe that the drive is 400K and will only format it or use it as 400K.

An Apple Macintosh IIfx with an FDHD and an 800K drive, booting under A/UX release 2.0.1 version SVR2 has the following symptoms:

- The 800K floppy drive is only recognized as a 400K drive.
- Part of the message from the A/UX kernel during boot reads "FD:floppy driver ver. 1.9; iop swim, D1 is 400K (1 head), D0 is an FDHD drive." "FD: D1 400K drive unusable."
- If the unit is not booting under A/UX, the 800K drive operates as expected.

DISCUSSION -----

It is a floppy driver incompatibility in A/UX 2.0.1 with a Macintosh IIfx. On a Macintosh IIfx, the driver incorrectly identifies the drive as a 400K drive, and claims it's unusable because 400K drive hardware isn't supported on the Macintosh II series systems. If you insert a blank floppy, however, you can format it, but only as 400K single-sided floppy. The drive is still usable as a 400K drive.

You can still read and write existing 800K floppies, even though the drive says you can't.

This problem has been fixed with A/UX 3.0 and above.
