A/UX: Solution to mount: <file system> already mounted Error

This article last reviewed: 15 October 1990

TOPIC -----

I tried to mount a file system and got the error:

```
mount: <file system> already mounted
```

DISCUSSION -----

Follow these steps:

1) Log onto the system as "root".

2) Enter the line: mount

A list of the currently mounted file systems will be displayed.

Example output:

```
/dev/dsk/c0d0s0 on / type 5.2 (rw,noquota)
/dev/dsk/c0d5s0 on /users type 5.2 (rw)
macaux:/s1 on /earlwl type nfs (rw,soft)
```

If the file system you trying to mount is listed, then it is already mounted. You may unmount the file system and mount it again to be sure.

1) Enter the command

```
umount
```

followed by a space and the absolute pathname of the file system directory. For example, the command "umount /users" unmounts the /user partition.

2) Enter the command

```
mount
```

followed by a space and the device name of the file system to be mounted, a space, and the absolute pathname of the directory on which the file

system will be mounted. For example, the command

```
mount /dev/dsk/c5d0s0 /users
```

mounts the file system associated with the device "/dev/dsk/c5d0s0" on the directory /users.
