TOPIC ---

How do I print a list of exported file systems?

DISCUSSION --

By using the "-e" option with the /usr/etc/showmount command, you can quickly
list the directories you have exported to other systems on the network.

Example output from the command line "showmount -e" executed the command line
from the system "my_system_name":

    export list for my_system_name:
    /users   machen redpony
    /   machen redpony

This example says that the directories "/" and "/users" are exported to the
systems "machen" and "redpony" only.

In A/UX 3.0, /etc/exportfs can be used. With no options, all exported
file systems are listed.
