## A/UX Response To Callback

Article Created: 6 April 1989

### Article Change History

-----  
08/31/92 - REVIEWED

- o For technical accuracy.

### TOPIC -----

If you need to dial into your A/UX computer and want it to dial you back before proceeding, try these steps and the example script that follows:

### DISCUSSION -----

- 1) Using "cu", "kermit", or other means, login into the remote UNIX machine.
- 2) Exec a program or a shell script saying "callback"; the "callback" should perform the following tasks:
  - Logout your current terminal session, hang up the phone line, put the originating modem in the listen mode, and set the proper TTY bits mode to be used as a dial-out port.
  - Wait a couple seconds, clear the phone line, and dial the phone number the user provided.
  - Do an "exec /bin/login" to respawn a login session.

Here is a short example of "callback" in a C Shell script. You may need to fool with the "stty -hupcl" command; do not hang up the modem on the last close. This example assumes that the remote modem is a Hayes or Hayes-compatible modem.

```
#!/bin/csh
if ($#argv != 1) then
    echo "Usage: callback YourHomePhoneNumber"
    exit
endif
set user=`whoami`
```

```

set number=$argv[1]
grep "$number" /usr/adm/callback.phones > /dev/null
if ($status == 1) then
    if ($user != root) then
        echo 'You are not allowed to use dialback because your phone'
        echo 'number can not be found in the dialout-phone list.'
        echo 'Please check the number and try it again.'
        exit
    endif
endif
# verify if it is a login shell
set pid=`ps -u$user |grep -c csh`
if ($pid[1] != 2) then
    echo "not login shell, pid=$pid"
    exit
endif
onintr we-are-back
set nohup
stty -hupcl -echo intr ^C
echo "Please hang up the phone. Or just turn the modem OFF and ON"
echo "I'll call you back in about 20 second."
sleep 15
echo -n x | tr "x" "\015"
sleep 2
echo -n x | tr "x" "\015"
sleep 2
echo -n x | tr "x" "\015"
sleep 4
echo -n "ATDT $number"
sleep 4
echo $*
# While you're waiting, log the usage of this script.
set dt=`date`
echo $dt[2-4] $user '      ' $* >> /usr/adm/callback.log
sleep 20
unset nohup
we-are-back:
stty hupcl echo
echo "HIT <Control-C>"

```

The above script has been tested and worked between a Macintosh SE (running MacTerminal) and an A/UX 1.0 system. You can modify it if it doesn't work on your system.
