## A/UX: Giving the System its Domain Name (6/93)

Article Created: 29 October 1990
Article Reviewed/Updated: 23 June 1993

TOPIC -----------------------------------------------------------

Why doesn't my system know its domain name?

DISCUSSION ------------------------------------------------------

This is a consequence of having an empty /etc/inittab file.  It happens
because the /etc/sysinitrc file is not being executed.  Once you recover
the /etc/inittab file, the system domain name will be defined correctly.
