A/UX: Changing Slice Number with dp (8/94)

Article Created: 18 December 1991

Article Reviewed/Updated: 30 August 1994

TOPIC -----

I have a problem with my A/UX hard drive (Micronet 400MB with all the database software). The drive was partitioned into 11 partitions, for example:

```
Swap : slice 1
Ingres : Slice 2
Oracle : Slice 3
Informix : Slice 4
```

Now I have several different partitions with the same slice number: slice 3. The partitions map seems to be OK (blocks, type of partition, and so on), except the slice number. Do you know if it's possible to change the slice number of a partition by using the dp command, and without losing the information?

DISCUSSION -----

First, make sure all partitions' physical starting locations don't overlap.

Suppose your Micronet disk drive's SCSI ID is 5, and has two disk partition entries (5 and 6) with the same slice number 3, and you want to change entry 6 with the new slice number 8. Log in as root and do the following:

```
# dp /dev/rdisk/c5d0s31
--->Command? p6          <==== Your input # view partition entry 6
--->Command? c6          <==== Your Input # change partition entry 6
--->DPME Field? b        <==== Your Input # change BZB
--->BZB Field? s         <==== Your Input # change slice number
--->Slice number + 1 [3]: 9 <==== Your Input # assign slice number 8
Note: [3] indicates the current slice number
--->BZB Field? q         <==== Your Input # quick BZB mode
--->DPME Field? q        <==== Your Input # quick DPME mode
--->COmmand? w           <==== Your Input # write changes
--->Command? q          <==== Your Input # quick dp
#
```

Note that the s slice number (bzb_slice) command in the BZB-field mode

isn't documented in either dp(1M) hard copy document or the dp(1M) on-line manual pages.
