Apple IIGS: Resetting And Buffer Clearing

Some Apple IIGS's will not reset when 'hung'.

The Apple IIGS has two levels of user reset: warm and cold. For a warm reset,
hold down the 'Control' key and press and release the 'Reset' key. A 'cold'
reset, which is a machine restart, requires you to hold down the 'Control' and
'Apple' keys and press and release the 'Reset' key, which makes the machine
reboot as if it were just turned on.

The computer can't possibly recognize these resets usually when an application
has bombed and hung the machine. The reset acts like any other keystroke in
this case; moreover, if you already have some of the other keys pressed and
waiting in the keyboard micro, the reset must wait its turn.

Remedy this problem with clearing the keyboard buffer by holding down the keys
control and Apple and then pressing the backspace key. You can then press the
reset sequence you want and the Apple IIGS can recognize it.
