AppleWorks: Version 2.0 requires 128K

AppleWorks 2.0 will not boot on a 64K Apple IIe. AppleWorks 2.0 requires 128K
of memory to run successfully; an Apple IIe with an 80-column card installed
will display the message "AppleWorks can only be used on systems with 128K of
memory" when later versions of the AppleWorks program are booted.

AppleWorks 2.0 can use as a RAMDisk the 256K to 1MB of memory in the Memory
Expansion Cards designed for and respectively used in the Apple IIe, Apple
IIGS, or the Apple IIc with a memory expansion slot. AppleWorks 2.0 will not
use an Apple IIe Memory Expansion Card in an Apple IIGS.
