AppleWorks: Early Versions Don't Support RAM Cards

This article last reviewed: 7 September 1989

TOPIC -----

I have upgraded my Apple IIe by installing a 512K memory expansion card.

When I tried to run AppleWorks 1.0.1, the memory accessed was only 10K. And when I tried AppleWorks 1.1.1, I got a message saying "not enough memory, need 128K". All this after installing the card and ProDOS. A diagnostics test, however, confirms that the 512K of RAM is available: yet AppleWorks still won't run.

DISCUSSION -----

Early versions of AppleWorks do not support memory cards; you need version 1.3 or later. Version 2.1 is available from CLARIS at an upgrade price. Contact them for an upgrade order form.

For more information, search on "CLARIS" in the Tech Info library.
