LOGO: Converting files to LOGO II

Apple LOGO is out in two versions: Apple LOGO and LOGO II. The later LOGO II does read conversions of program files of the earlier Apple LOGO. The CONVERT utility makes these conversions; CONVERT is on the ProDOS System Utilities and IIc Utilities Disks.

Keep in mind, however, these two facts:

1. Some commands are different in the later version, LOGO II. You must check each line of the file converted from Apple LOGO for commands that LOGO II does not recognize. If LOGO II doesn't know how to do an Apple LOGO command, you will have to update the command to the appropriate LOGO II command.

2. The converted files may contain references to the names of LOGO procedures that have different names in LOGO II. There may also be references to procedures that perform functions you do not want performed. These problems with names came with the addition of new built-in procedures or primitives in LOGO II. Again, as with the commands, you must check each line of the converted file for procedure name references that are erroneous or unintentional.
