Catalyst 2.0: Apple Writer III 2.0 installation

Catalyst's Automatic Install exhibits problems when installing Apple Writer III version 2.0 on the ProFile. The problem usually manifests itself with a stack overflow (System Error \$06) upon selecting the menu option.

Quark is not sure of what the problem is, but it appears that the person adding Apple Writer III to the Catalyst Menu must have both the Catalyst Master and Catalyst Backup diskettes on hand when doing the installation. As the automatic install program runs, it needs the Catalyst Backup diskette and displays a request for it. Do not ignore this request during the installation. If you do try to bypass this step with the Escape key, the installation seems to proceed normally--yet Apple Writer does NOT install and generates a Stack Overflow error whenever you select Apple Writer III from the Catalyst menu.
