Fonts: Documents on Macintosh and Windows (6/94)

Article Created: 16 Jun 1994

TOPIC ---

Does the Macintosh operating system, or a 3rd party offer auto font substitution
of some form for Macintosh users?

If not, are Macintosh and Windows users forced to agree on a common set of fonts
in order to exchange documents reliably?

DISCUSSION ---

The cleanest way to exchange documents between Windows and the Mac OS is (as you
suggest) to have users agree on a common set of fonts.

If it isn't possible to get the users to come to an agreement on Fonts Types,
Styles and sizes, and the system substitution isn't acceptable, then it will be
necessary for you to purchase a third party solution for document distribution.
Most of these packages will also maintain the integrity of graphics as well as
fonts. The following is a list of four popular packages for this purpose:

Company   Package

WordPerfect   Envoy
Adobe   Acrobat
No Hands   Common Ground
Farallon Computing   Replica

You would be best advised to call these companies and explain your requirements
to make sure that this is the type of solution that they are looking for, or if
you need more information on the products.
