ARA MultiPort Server Shares User Data With AppleShare (11/93)

Article Created: 15 November 1993

TOPIC ---

This article describes the sharing of user database information between
AppleShare and Apple Remote Access (ARA).

DISCUSSION --

If you have installed the Apple Remote Access MultiPort Server on the same
computer as your AppleShare server, the user database is shared between
them. The user database is called the "User List" in ARA and the "Users &
Groups Data File" in AppleShare.

All users from the AppleShare Users & Groups Data File appear in the Remote
Access Manager User List as registered users, but you must select login and
callback options for them. Remote Access Manager does not support the
AppleShare Groups feature; any groups that you have created with AppleShare
do not appear in the User List.

IMPORTANT: Any changes you make to the User List, such as adding or
deleting users, will affect the AppleShare Users & Groups Data File.

Any changes that you make to a User information window, such as changing
the login name or password, also affects the AppleShare Users & Groups Data
File.

IMPORTANT: Since AppleShare Admin and Remote Access Manager use the same
user database, you cannot run both applications at the same time. However,
if you lock the Remote Access Manager, you can run the AppleShare Admin
application. To lock the Remote Access Manager, choose Lock Server Manager
from the Server menu.
