ARA 2.0 Client: Network Installer Instructions (1/94)

Article Created: 20 January 1994

TOPIC --

These are instructions for creating a net install version of Apple Remote
Access, using the Apple Remote Access Client set of three floppy disks.
This net install version can be stored on an AppleShare File Server or File
Sharing volume, and then installed over an AppleTalk network onto a
AppleShare Workstation Client Macintosh.

DISCUSSION ---

The AppleShare System Administrator should choose the volume where this net
install version will be located. Create a folder called (for example) ARA
2.0 Client Net Install, and drag copy each of the three disks into it.
This is done by inserting a disk, selecting the icon on the desktop that
represents that disk, and dragging it to the ARA 2.0 Client Net Install
folder. Continue until all three disks have been copied.

Double click on the folder called ARA PS Install 1, to open it. Select and
drag the file named Installer (the actual Installer application) from the
ARA PS Install 1 folder, to the ARA 2.0 Client Net Install folder. Repeat
this process for the file named Remote Access PS Install (the Installer
script). You are now done.

Now, any AppleShare Workstation Client who has access privileges to the ARA
2.0 Client Net Install folder, can navigate to there, double-click the
Installer application or the Installer script, and install Apple Remote
Access onto their system, across the AppleTalk network.
