Apple Remote Access: Dialing String Length (10/95)

Article Created: 25 October 1995

TOPIC ---

I'm using the Apple Remote Access (ARA) Client 2.0.1, and I want to enter a 39
character string in the Long Distance Access setup of the Dial Assist control
panel (10 digit phone number, 2 commas, 14 digit credit card number, 4 commas,
and 9 digit phone number). When I have tried to connect, ARA seems to only dial
the first 31 characters. Is there a limit of characters ARA can dial?

DISCUSSION ---

This is not a limitation of ARA. Different modems may have different maximum
command line lengths that they will accept. This maximum is defined in the mlts
resource of the modem script. If an mlts resources is not defined then ARA
assumes a default length of 30 characters. ARA also provides the ability to
break one long string up into substrings, but the specific modem script must be
written to take advantage of this feature. If the modem script you are using
does not dial all the characters you are entering contact the modem manufacturer
for an updated script.
