AppleShare Server: One Log on per Workstation

This article last reviewed: 16 May 1989

Some AppleShare administrators have inquired if there is anyway to partition a server volume into application and work file sections, so that users could mount applications more quickly. In effect, they want users to log on to multiple volumes on a single AppleShare server.

Although this approach could speed up user access time, the problem is that when connecting to an AppleShare File Server, the user logs on to the server itself; not the individual volume. The current implementation of AppleShare File Services does not allow multiple logging on to a server from a single workstation. Allowing multiple connections could create situations that would severely confuse the Finder. To eliminate this as a possibility, each workstation is allowed only one connection to any server.
