AppleShare: Installing on Systems that Require System 6.0.4

This article last reviewed: 19 February 1991

TOPIC ---

I recently purchased a Macintosh IIci as an AppleShare file server. My
version of AppleShare File Server (2.0.1) is on an 800K diskette and cannot
be used because it does not have System Software 6.0.4 on it. Is my only
alternative copying the applications to a 1.4MB diskette that has System
6.0.4 on it?

DISCUSSION ---

In order for you to install AppleShare or some of our other networking and
communications software on our newer computers, use the Network Products
Installer diskette. This disk contains the latest System software and
installer scripts as a pre-boot for the actual installer diskette. Just
boot from the NPI disk, launch the particular Installer script, and the
Installer will prompt you for the appropriate diskette.

The NPI diskette is currently shipping with all new systems that require
System 6.0.4 or higher.
