AppleShare: Problems Installing with System 6.0.5

Article Created: 14 June 1991

TOPIC -----

I'm trying to set up an AppleShare file server on a Macintosh SE/30 with System 6.0.5. I used the Installer on the AppleShare File Server Installation disk, choosing only the AppleShare installation (in other words, not using the Macintosh System installation option). So far so good.

However, when I attempt to load files from the Server Administration disk, I get the message that the System file on that disk is not a recent enough version (it was System 6.0.3).

DISCUSSION -----

You need to run the Installer from a System 6.0.5 disk and create a new floppy using the option to install minimum system files for the Macintosh SE/30. After you create that startup disk, drag the AppleShare Admin program onto that floppy. You'll then be able to start up from the floppy and run the AppleShare Admin program.
