TOPIC -----

I have 35 computers on my AppleShare network and need to add 20 workstations. I have a star controller. Do I need to divide the network into zones? Do I need to add a bridge? Do I need to add another file server?

DISCUSSION -----

If you go over the 50-user limit, not everyone will be able to log on to your server at the same time and the network will slow down.

Another AppleShare file server is needed. We also suggest you add an Apple Internet Router that runs in the background on the servers. This will enable you to break up your network into logical zones. Each Internet Router supports two LocalTalk networks. You also might want to consider using an Ethernet backbone between the servers to speed things up.
