AppleShare Client Software Compatible With System 6.0.x (7/93)

Article Created: 2 July 1993

TOPIC ---

I'm trying to make a bootable 800K floppy for my Macintosh Plus that has
system 6.0.x and AppleShare client software so I can mount my file server.

AppleShare appears to be working fine until I get to the point of selecting
the volume I want to mount. I get the message about the desktop file on the
volume needing repair. When I click on "ok" to repair it, I get into a
loop with the dialog box saying the desktop file couldn't be created and
then there's nothing I can do but reboot.

I am using System 6.0.7 from the Disk Tools disk and tried it with
AppleShare from System 7.0.1. What's going wrong?

DISCUSSION --

There is a compatibility problem when using System 7.0.x version of the
AppleShare client software with System 6.0.x. System 7.0.x AppleShare
client software should only be used on System 7.0.x systems.

System 7.1 AppleShare client extension and AppleShare 3.0.x client
extension are compatible with System 6.0.x. The installer disks should be
used to install one of these versions onto a 6.0.x system.
