AppleShare: Expired Password and Auto Log On (6/95)

```
Article Created: 17 April 1995

TOPIC -----------------------------------------------------------

With AppleShare 4.0.2, I have my users' passwords set to expire after 90 days. I
also have the users set to auto log-on at start up. When a user's password
expires and their computer tries to log-on during startup, they receive no
notification that their password has expired, unless they connect to the server
through the Chooser. Is this normal?

DISCUSSION ------------------------------------------------------

Yes, this non-response is normal activity when a password expires and your
computer is set to auto log-on to the server. This happens with AppleShare
3.0.x, 4.0.x, and 4.1. The password has expired message from the server is not
seen by a user until they select the server through the Chooser.

Also a server's alias will report that it can't find the server on the network
when a users password has expired. In either case you can choose the Chooser
from the Apple menu, select the server, and enter your new password when
prompted from the password has expired message.
