Internet Router: Local Net Setup Conflict

This article last reviewed: 13 November 1990

TOPIC -----

Regarding the AppleTalk Internet Router, what conditions cause the Local Net Setup Conflict statistic (shown in the Port Statistics window)? How do you locate and correct the problem?

DISCUSSION -----

The AppleTalk Internet Router manual states:

"A Local Net Setup Conflict error is reported if another router on a network that is directly connected to this router lists a conflicting network number or range for that network."

This statement indicates that there is another router on the same physical cable as the AppleTalk Internet Router that is advertising a network number or range for that physical cable that is different from the network number or range in use by the AppleTalk Internet Router. The key to correcting the problem is to locate the routers that are attached to the physical cable with the problem and verify that they all are using the same network number or range for that physical cable.
