AppleTalk v58.02: Conflicts with Shiva Products (8/93)

Article Created: 9 August 1993

TOPIC ---

I'm having problems using a Shiva EtherGate after I installed AppleTalk
v58.02 from the NSI 1.3.3. It can now take five minutes for the Network
Control Panel to open when selecting the Shiva driver. When I ran the
standard System 7.1 Network C-Dev it opened fine. I'm using 58.02 for
Shiva's Ethernet box to work. What could possibly be causing this?

DISCUSSION --

We checked with Shiva Tech Support who confirmed that Shiva EtherGate (and
NetModem), produce the symptoms you describe above when used with any
Macintosh running AppleTalk v58.02. When you loggon with the EtherGate
they are hearing complaints that it may take 5 or more minutes to make the
connection, (and 2 or more minutes when using the NetModem), during which
time it appears that the Macintosh has hung. Once the connection is made
everything else works fine at expected performance levels. Nevertheless,
they recommend dropping back to an earlier version of AppleTalk prior to
v58.02, such as v58, to avoid these long loggon times, until they are able
to revise their drivers. The current version of the EtherGate software is
1.6.1, and is posted on AppleLink in the third party bulletin board.
