SMB File Transfer: Troubleshooting Macintosh IIfx Problems

This article last reviewed: 7 June 1990

TOPIC ---

I am having problems with a Macintosh IIfx and SMB File Transfer. I used the
6.0.5 Network Installer disk, and everything seemed to go well. The TokenTalk
NB Card is working fine; I can see the zones and devices in the Chooser. Apple
File Exchange starts up OK. However, when I try to access the "SMB Servers"
choice from the Apple menu, the whole system hangs. I tried using the later
versions (1.1.1) of the A/ROSE and TokenTalk Prep files from the MacDFT Golden
disk, but I had the same results. Can you help?

DISCUSSION --

We tested the SMB File Transfer Utility with our Macintosh IIfx, and it worked
fine. We did not have to use A/ROSE and TokenTalk Prep from the MacDFT Golden
disk. We used the version 1.0 SMB software disk, which installs A/ROSE 1.1,
PCSession Prep 1.1, SMB 1.0, and TokenTalk Prep 1.1 in the System Folder.

Here are some troubleshooting suggestions:

Check cable connections. Verify that the SMB server is up. Make sure you are
using Apple File Exchange 1.1.2. (Earlier versions of AFE will not work.)

- Ensure that you are using version 2.12 ROM on the TokenTalk NB card.

- Remove any INITs in the System Folder that might cause a problem.

If you are still having problems, please send us more information,
specifically:

- Hardware and software configurations and versions, including any network
  hardware and software.

- Other applications on that system, including INITs, CDEVs, and so on.
