AppleShare PC: Memory Use

This article last reviewed: 11 May 1988

Some users have asked about the amount of RAM that AppleShare PC occupies in a PC.

The amount of memory used is:

- No resident DA or other options: 127,344 bytes
- DA resident with expanded memory option: 90,176 bytes
- DA resident (no graphics or memory options): 200,416 bytes
- DA resident and high-resolution graphics support: 215,776 bytes

The totals for the PC files loaded into memory include ATALK.EXE, ASHARE.COM, MINSES.EXE, REDIR.EXE, DA.EXE, DA.DTA, DA.HLP, and ANET.EXE.

Not all of the programs are loaded at once. Those that are not loaded have code segments or overlays sharing allocated space. For this reason, the file size is not the same as the allocated memory size. These numbers represent the allocated total space within memory for the mentioned files.
