AppleShare PC: Intermittent Connection Anomaly Eliminated

This article last reviewed: 17 March 1989

AppleShare PC version 1.0 displayed an "intermittent connection anomaly". That is, it occasionally dropped connection to the printer, was randomly unable to see the printer or the servers, and so on.

The primary change in later versions concerned this intermittent network connection. The first step in resolving the connection issue is to update all AppleShare PC workstations to the current software (currently, v1.2 is the latest). There is no point considering other possible causes of disappearing network resources until the PC workstations are updated.
