## How to Remove AppleShare PC Code from PC Memory

This article last reviewed: 10 January 1991

TOPIC -----

I am running AppleShare PC (2.01). Currently, WordPerfect runs on the PC (with 512K RAM) until I start AppleShare using ABOTH. After checking E-mail, which is the main reason I use AppleShare PC, I type AOFF to kill AppleShare, but WordPerfect no longer has enough room to fully execute. Only a warm reboot with Control-Alt-Del frees up the memory. Is there any way (short of rebooting) I can free ALL memory after typing AOFF?

DISCUSSION -----

There is a way to remove all AppleShare PC code without rebooting. It requires the use of mark/release utilities. This kind of program is used to mark a position in memory so that TSR programs and drivers loaded later, like AppleShare PC, can be removed with the companion release program.
