### TOPIC -----

I need a UNIX terminal emulator (to run on a Macintosh) that will do the following:

- Toggle between 80 character mode to 132 character display
- reverse video
- Downline load ASCII files

### DISCUSSION -----

UNIX systems support almost all types of terminal available. One of the most popular terminal types supported is the Digital VT100 series. Lots of Macintosh programs support this terminal type, especially the later ones which use the Communications ToolBox.

MacTerminal 3.0 allows you to use the VT102, or the VT320 Tools. In the Screen setting, you can toggle between 80/132-columns, and select inverse video. In the File Transfer setting, you can select files transfer using the Text Tool, or the XModem Tool.

Pacer's PacerTerm and Synergy's VersaTerm-Pro also use the Communications ToolBox and support other Tools besides the Apple Tools.
