Connecting to ABANET via Telenet

This article last reviewed: 27 November 1990

TOPIC -----

I need to connect to ABANET. According to the information I received from ABANET they can be reached through Telenet. How can I reach ABANET via Telenet. I have a connection to the Belgian DCS network (Packet network, X.25).

DISCUSSION -----

It sounds like ABANET has subscribed with Telenet, a X.25 Public Data Network provider, to get access to the X.25 PDN via Telenet. As a subscriber on a PDN, ABANET would have been given a unique address, not unlike your telephone number, that could be broken down into the world zone, country zone, a network digit and network terminal number.

Therefore, to reach ABANET from another X.25 PAD, like MacX25, you just need their address. From MacX25 you enter that address in the "Host Address" or "Called Address" field. Then, open the connection via a terminal communication tool (MacTerminal 3.0, White Pines Mac241, or the like). Their address will be understood by your local PDN provider's packet-switching equipment and your call request will be routed through whatever PDN networks are required to reach ABANET.
