Megaphone 1.0.3P: Read Me (6/96)

```
Article Created: 14 June 1996

TOPIC -----------------------------------------------------------

This article contains the ReadMe file for Megaphone 1.0.3P.

DISCUSSION ------------------------------------------------------

In order to use MegaPhone 1.0.3P, it is recommended that you also install Audio
Volume Extension 1.1 and Telephone Manager 2.0. Look for these extensions in
your Extensions folder inside the System Folder. If they are not installed,
download the software from Apple SW Updates and install them before using
MegaPhone.

MegaPhone 1.0.3P Info
---------------------
This is the release of the 1.0.3 code base for Performas which has the same
feature set as described for 1.0.2P. This version ships with the 5200, 5300,
6200, and 6300 desktop computers. All users of 1.0.2P can move forward to
1.0.3P.

Major problems addressed (in addition to those addressed for version 1.0.3):

1. For some users, on some calls, once the call was connected, MegaPhone would
hang up. This is fixed.

2. For some users, the volume of the recorded messages was very low. The volume
has been increased a little. (Some users are also able to fix this problem by
adjusting the recording volume in the Telephone Setup control panel).

3. This version works with the Global Village TelePort Platinum V and the Global
Village TelePort Gold IIv modems.

4. Users using pulse (rotary) dialing could not dial long distance numbers. This
is fixed.

Installing MegaPhone 1.0.3P
---------------------------
This version of the installer will install all of the software components needed
to run MegaPhone on your Macintosh Performa.
```

To install MegaPhone, double click on the file named "Install MegaPhone". Choose
the hard disk you wish to install on, and then select the "Install" button.
After you restart your machine, you can then launch MegaPhone. There will be a
MegaPhone folder located inside your Applications folder.
