Network Server: SMIT, AppleTalk Admin Tool Function Keys (5/96)

Article Created: 8 May 1996

TOPIC ---

How can I run SMIT with the CommandShell AppleTalk Administrative Tool on the
Network Server 500 or Network Server 700?

The default VT-102 tool only gives me F1 through F4 function keys does not let
me manipulate SMIT. I tried the VT-320 tool with MacTerminal which I did have
working with ClarisWorks and a serial connection to the server, but I could not
get the same settings for VT-220 emulation to work in CommandShell.

How do I get other function key functions?

DISCUSSION ---

There is a built-in alternative to the function keys.

You can use the sequence "Escape Key - Number Key".

This will let you navigate the different menus in SMIT while in a terminal
emulation session from the CommandShell windows, Text based Console Window,
Telnet session, and so on.

For example, from the CommandShell window, if you need to enter F4 (Function Key
4) to generate a list of options for a field, you can enter the sequence Esc 4 (
Escape key - Number 4 key) and obtain the same result.
