Macintosh: VT101 Emulation

This article last reviewed: 10 August 1987

The VT101 is a superset of the VT100, adding eight enhancements. According to the engineers that developed MacTerminal 2.2, it is supported to an extent by the entire the Macintosh line. MacTerminal defaults to the complete VT100 with two of the VT101 enhancements. These two features are implemented in:

1. Insertion of lines
2. Deletion of lines

These 2 changes increase the speed of line editing because the length of the escape sequence is substantially shorter.
