DAL for VTAM Installation: The 'APPC=' Parameter

Article Created: 4 January 1993

TOPIC ---

In the VTAM APPL of the VTAM server, the "APPC=NO" parameter caused trouble
(see page 5 of the MVS/VTAM Server Installation and Operation Guide). My
understanding of the parameter is that if I need a LU 6.2 connection with the
VTAM server, I should set this parameter to "APPC=YES".

That was what the system programmer did, when he installed the server.
After hours of analyzing the installation, we found out that the DAL server
didn't react to a CINIT from the host's SSCP.

When we changed back to the default "APPC=NO", it worked. What is the
meaning of the parameter and its two values?

DISCUSSION --

The "APPC=" parameter specified in the Install Guide on page 5 should be set
to "NO", because this parameter refers to whether the applid will support
Independent LUs. Because VTAM, at the current release, and DAL (releases
1.3 and 1.3.5) do not support Independent LUs, set this parameter to "NO".
