TOPIC -----------------------------------------------------------

Are you folks aware of a Macintosh product that controls a ROLM 244-PC
phone? I am looking for something with the same feature set as IBM's
"Personal Telephone Manager"

DISCUSSION ------------------------------------------------------

There is a Macintosh ROLM 244-PC phone "control" application:

The ROLMphone 244PC is a smart, voice and data-communications telephone
that links personal computers to the ROLM 9751 CBX and ROLM CBX II family
of voice/data controllers.  It combines a digital ROLM telephone with data
communications features that support the "AT" intelligent modem command
set.  The ROLMphone 244PC also includes a documented programming interface
(API) that lets programmers design specific, telephone-enhanced
applications in areas like outbound dialing, inbound answering, telephone
management, and integrated voice/data applications.  The documented
ROLMphone 244PC API lets a user write customized applications.

You may wish to contact ROLM's direct sales and support team for a copy of
the API documentation and write your own control program.
