Apollo To Macintosh II Connectivity

This article last reviewed: 27 July 1988

Some users have asked about exchanging Interleaf documents between a Macintosh II running Interleaf, and an Apollo DN3000 workstation (also running Interleaf).

There are two methods of connecting the Macintosh II to the Apollo:

- A serial connection (either direct or via modem) using Kermit to move the file in either direction.
- Apollo has two network environments, Apollo's Domain and Ethernet. In the Domain environment, Macintosh and Apollo have no way to connect over the network. However, if the Apollo system has the Ethernet option installed, Macintosh and Apollo can move files via NCSA (National Center for Supercomputer Applications) Telnet & FTP.

For more information, search under: "Kermit File Transfer Protocol", and "National Center for Supercomputer Applications"
