Macintosh-to-Sytek Broadband Connectivity

This article last reviewed: 8 June 1990

TOPIC -----

We use a Sytek broadband network with Novell Netware as a standard. Is there any product that lets the Macintosh participate in such a network?

DISCUSSION -----

You should look into a router that routes from LocalTalk or baseband (EtherTalk) to broadband. One such router is the MultiGate 2000 from Network Resources Corporation, which has the ability to connect AppleTalk networks to EtherTalk, broadband, or fiber-optic networks.

The MultiGate 2000 supports Novell, among other network environments, and would give you the flexibility to use LocalTalk or the EtherTalk NB Card, or such Ethernet interface products for compact Macintoshes (and so on, Macintosh SE/30) as the Kinetics EtherPort SE/30. For more information, refer to the Technical Info Library article called "NRC Series 2000 AppleTalk Routers: Description" or contact: Network Resources Corporation.

Other possible solutions are described in the Technical Info library article "Macintosh-To-Novell Netware With AppleTalk" or can be located by searching on "broadband" in the Technical Info library or in either of the buyer's guides on AppleLink. For contact information, search the Technical Info library under "Technical Info library."
