OfficeVision and Macintosh Connectivity: PIXI

This article last reviewed: 13 December 1990

TOPIC -----

I am looking for information on Macintosh-to-OfficeVision connectivity.

DISCUSSION -----

There is a product for Macintosh-to-OfficeVision (and DISOSS) connectivity called PIXI (Personal Services Import Export) from IMI Computing. The product reportedly works in conjunction with DCA's MacIrma product. Its features include:

- Uploading and downloading Personal Services in-basket or filing cabinet entry(s) to the Macintosh. It also provides file transfer with both OfficeVision/MVS and Personal Services/CICS.
- Binary files can be transferred in native form for filing or distribution through Personal Services or DISOSS.
- PIXI MacIrma determines the document type as either RFT, EDITABLE, or PC FILE depending on the contents of the data. Macintosh ASCII files are automatically converted to EDITABLE if required. Macintosh RFT files are shared with other users unchanged (as RFT).

The product requires DCA's MacIrma hardware and APIs. On the host, you must also install the standard PIXI host component.
