TOPIC -----------------------------------------------------------

Can a Macintosh LC attach to DigiCard network?

DISCUSSION ------------------------------------------------------

DIGICARD can connect Apple Macintosh 512kE, Macintosh Plus, Macintosh SE,
Macintosh LC, Macintosh Classic, and Macintosh IIsi computers to its
networking system without any extra hardware.  All that is required for
each Macintosh is an external isolater box such as PhoneNet or DIGICARDs
own brands AppNet, or for more permanent installations, a wallplate outlet
called Cablepoint.

Apple IIe, Apple IIGS, and IBM PC compatibles require a network interface
card to connect to the DIGICARD network.  There are three types of
interface cards: one for the Apple IIe or Apple IIgs, one for the Apple
IIgs only, and one for IBM PC compatibles.

MacLagan & Wright are the developers of DIGICARD. They are based in
Australia, and may be contacted on AppleLink @ AUST0170.
