## 3270 Dial-In for the Macintosh: Use MacTerminal

This article last reviewed: 25 February 1991

TOPIC -------------------------------------------------------------

Can my Macintosh dial in remotely to an IBM 3708 and get 3270 terminal
emulation? Is there a Macintosh equivalent to FTTerm, a DOS product that
does this on the IBM?

DISCUSSION --------------------------------------------------------

3270 emulation is available from the Macintosh side with MacTerminal.  This
is Apple's data communications product and should work just fine in this
environment.  You will need to verify with the network administrator that
there is the capability in the host for remote dial-in support.  If so,
have it set up on the host and you should be in business.
