PowerShare: Moving Servers (9/93)

Article Created: 28 September 1993

TOPIC -----

How do I move a PowerShare server from one Macintosh to another Macintosh?

DISCUSSION -----

Every PowerShare server includes the application, its data files and a preferences file. By moving a PowerShare Catalog Server, you can maintain your PowerShare catalog structure without having to rebuild the PowerShare System by recreating the folder hierarchy and all your data records. The list below identifies the tasks you must perform when moving the server to a new location:

- 1) Reinstall the Server software from the original disks.
- 2) From the top folder level, copy the PowerShare Catalog Data folder and PowerShare Mail Data folder to the top folder level on the new disk or volume.
- 3) From the Preferences Folder in your System Folder, you also need to copy the files PowerShare Catalog Prefs and PowerShare Mail Prefs. These files should both be copied to the Preferences folder on the new Macintosh. (You don't need to move these items if you are moving the servers to another volume that won't be a startup volume.)

Note: After you restart the servers you have moved to a new location, you may need to identify the volume on which they are stored.
