## PowerShare: Replicating a Folder (9/93)

Article Created: 28 September 1993

TOPIC -----

How do I replicate a folder on a PowerShare Catalog Server?

DISCUSSION -----

Use the PowerShare Admin application to replicate a folder on any existing PowerShare Catalog server. Replication of folders provides better performance in larger or frequently accessed folders by shifting the workload between servers.

To replicate a folder:

- 1) Start the PowerShare Admin application if it is not already running and switch to Manage Mode.
- 2) In the System window, select the catalog server on which you want to store the folder copy and click the Open button.
- 3) When the server window opens, choose Catalog Folders from the pop-up menu of display options.
- 4) Open the Catalog window and display the folder that you want to replicate.
- 5) From the Catalog window, drag the folder icon to the "Catalog Folder Name" area at the bottom of the server window. When you release the mouse button, the folder now appears in the listing of catalog folders residing on the selected server.

The load for managing the folder will now be distributed between the two servers on which it resides. Notice that on the Macintosh where the newly added server is running, the status window for the server now indicates that it is serving the specified folder. From now on, any change you make to the folder is replicated on both servers.

Note: In the catalog window, the replicated folder is still only represented as a single folder; replication does not affect the organizational structure of the catalog.
