## Macintosh Plus : Won't Boot With SCSI Peripheral Off

Article Created: 3 February 1986  
Article Last Reviewed: 17 July 1992  
Article Last Updated:

**PROBLEM DESCRIPTION:** The Macintosh Plus won't boot with a powered off SCSI device connected.

**CAUSE:** Macintosh Plus boot ROM checks the SCSI port upon boot-up. If there is a SCSI device connected, the Macintosh tries to communicate with it. Of course, if the device is off, it will not respond and the Macintosh Plus will hang while it is waiting for a response from the SCSI device.

**CURE:** Disconnect the deactivated SCSI device or turn it on.
