Macintosh IIci: Speeding Up 24-Bit Graphics

Article Created: 18 April 1991
Article Last Reviewed: 10 July 1992
Article Last Updated:

TOPIC -----

Which speeds up a Macintosh IIci's 24-bit graphics more: a cache card or a Macintosh Display Card 8•24 GC?

DISCUSSION -----

By far the best choice for speeding up 24-bit images is the Macintosh Display Card 8•24 GC. Off-loading the graphics processing from the central processor speeds up screen imaging and "number crunching" (as neither is interrupting the other).
