TOPIC -----

What is the impedance for the audio port of a Macintosh IIci?

DISCUSSION -----

According to the Apple Macintosh Family Hardware Reference manual:

"The external sound jack is at standard line level (approximately 1.5 volts peak-to-peak) and its source impedance is approximately 47 ohms. The jack is capable of driving a headphone load of 8 to 600 ohms, or the input to almost any audio amplifier or amplified speakers. It will not adequately drive a directly connected external speaker. The sound jack is short-circuit protected."
