Macintosh IIci: Does Not Use VRAM

Article Created: 14 May 1991

Article Last Reviewed: 10 July 1992

Article Last Updated:

TOPIC -----

Is 512K VRAM available on the Macintosh IIci?

DISCUSSION -----

The Macintosh IIci does not use VRAM (video RAM), nor can be expanded with VRAM. The computer uses main system RAM from Bank A of the logic board.

If there is at least 2MB of RAM on the logic board, you will be able to access the maximum pixel depth for the attached monitor: for a High-Resolution RGB Monitor set to 256 colors, that amounts to 384K of RAM taken for video.
