Macintosh Nubus Cards: Effect on Power Supply

Article Created: 15 April 1991

Article Last Reviewed: 25 June 1992

Article Last Updated:

TOPIC -----

Is there a problem with putting three or more NuBus cards in a Macintosh II family system?

DISCUSSION -----

Not inherently, but the more cards you install, the greater the drain on the power supply. If the power supply was bad, it might not show up until it was under this increased load. Some card makers don't follow Apple specifications about power draw per card. Out-of-spec cards can strain the power supply.
