MacTest 6.0: Wrong Error Number During Test Of External Drive

This article last reviewed: 9 November 1988

MacTest 6.0 displays an erroneous error number during the external drive test when it's run for the first time. You can perform a valid test without rebooting simply by running the external drive test a second time.

Follow these steps when you want to use MacTest 6.0:

1. Boot MacTest 6.0 on either a 512K or 128K Macintosh. Run all tests by choosing Start.

2. If all is well, Pass will be highlighted. Choose Select Test, then specify that only the external drive test be run.

3. Click on Start. MacTest will return a Failed message with the number 50010.0004.

4. Click on Start again. This time the drive test should run properly. If the external drive is good, the test will indicate "Pass"; if the test returns a "Failed" message again, the drive is indeed faulty.
