Article Last Updated:

TOPIC -----

How can I tell if my Macintosh has a coprocessor installed?

DISCUSSION -----

If you want to know if you have an adapter (with a coprocessor) installed in your Macintosh without checking the computer physically, you need to use a software utility: nothing in the Macintosh operating system gives you this information.

There are several shareware CDEVs that report system configuration, as well as many disk and file utilities, such as SUM II and MacTest. Also, some applications (Microsoft Excel is one) report the presence of a coprocessor. Copyright 1991, Apple Computer, Inc.
