## Macintosh IIVx: B & W Mode Unsupported by 12 RBG Display

Article Created: October 19, 1992

TOPIC -----

Why doesn't my Macintosh IIVx support black and white mode on my 12" RBG Display?

DISCUSSION -----

The Macintosh IIVx internal video logic does not support one bit per pixel mode on the 12" RBG Display.

When the Monitors desk accessory is launched, only 2, 4, 8, and 16 bits per pixel options are offered for that display.

There may be some applications that require black and white mode.
